United States Marine Corps light armored reconnaissance (LAR) company ops.

Edge of The Web: By Capt. Max Marshall, 2025 Pete Ellis 2d Place.

Marine Corps Association. Posted 15Jan2026

Good—this is exactly the right move. I'll do this **inside your own grammar**, not translate it into doctrine or psychology. I'll keep it tight, structured, and usable.

I'll proceed in three layers:

1. **Reframe sentence (clean, trial-safe)**
2. **CST analysis using JPP**
3. **Mapping to NV (Narrative Vector) and APR (Agency–Pressure–Response)**

No drafting beyond what you asked; this is analysis + reframing logic.

1. The Reframe (Outcome First)

Proposed reframe (core sentence):

Her expertise didn't make her skeptical. Tesla's "Safety-First Sensors" framing functioned as a technical signal that invited inquiry. What it induced was not belief, but professional curiosity—attention calibrated by expertise, not suspended by it.

That sentence is doing the work you want **without** implying weakness, gullibility, or cultural essentialism.

Now let's justify it using **CST → JPP → NV/APR**.

2. CST Analysis Using JPP

A. JPP Axis 1: Judgment Gyroscope (Discernment Under Motion)

Old framing problem ("credulous"):

- Credulity collapses the gyroscope
- It implies loss of balance, not orientation
- Defense can spin it as "she leaned forward too far"

Correct CST framing:

- Her judgment did not fail
- It **entered motion in response to a signal designed to invite motion**

In JPP terms:

- Tesla applied **rotational force** (technical marketing cues)
- Her judgment **precessed**, it did not topple

This is critical:

Curiosity is *stable motion*, not error.

So the correct claim is:

- Tesla **induced precession**, not belief
 - The system failed **after** judgment did what judgment is supposed to do
-

B. JPP Axis 2: Wu-Wei Timing Belt (Induced Engagement)

Tesla's "Safety-First Sensors" did not command trust. They **lowered resistance at the precise moment curiosity naturally arises** in an expert system.

That's classic wu-wei misalignment:

- No force
- No coercion
- Just *timing + signal*

In CST terms:

- Tesla didn't push
- Tesla **removed friction at the wrong moment**

This matters because:

- The defense wants "assumption of risk"
 - You're showing **assumption of invitation**
-

C. JPP Axis 3: Harness / Yoke (Role Assignment)

Tesla implicitly assigned her a role:

- *Not* consumer
- *Not* critic
- **Peer-adjacent evaluator**

That's the yoke:

- “You understand systems like this”
- “This meets safety-first architecture”
- “You know what redundancy looks like”

She stepped into the harness **they offered**.

Under CST:

- Agency was *channeled*, not surrendered
- Reliance arose from **role coherence**, not deference

3. NV — Narrative Vector Analysis

Old Vector (Bad)

Expert → Credulous → Injured

That vector:

- Collapses dignity
- Invites juror distancing
- Hands defense the word “mistake”

Correct NV (Aligned)

Expert → Signal Detected → Curiosity Engaged → Reliance Reasonably Formed → Harm

This vector has three advantages:

1. Keeps her *active*
2. Keeps Tesla *initiating*
3. Places failure *after* reliance, not inside it

Key CST point:

Curiosity is not a flaw state; it is a **transition state**.

And transitions are where systems owe their highest duty.

4. APR — Agency / Pressure / Response

This is where the reframing really locks.

Agency

- She retained agency throughout

- She evaluated signals
- She did not outsource judgment

Pressure

- Pressure was **epistemic**, not emotional
- Tesla applied **technical credibility pressure**
- “Safety-First Sensors” is a *pressure phrase*, not puffery

Response

- Her response was **attention**, not trust
- Engagement, not belief
- Reliance formed *after* engagement, not before

So the legal-moral claim becomes:

Tesla exploited the normal response of expert agency to technical signaling.

That is clean. That is powerful. That is very hard to rebut.

5. One-Line CST Summary (For You)

If you want the CST shorthand you can reuse elsewhere:

Her expertise functioned as an antenna, not a shield. Tesla tuned the signal.

That line is:

- CST-accurate
- Jury-intuitive
- Doctrinally safe

Final Note (Important)

I’m deliberately **excluding ethnicity as causal explanation** here—not because it’s untrue at a human level, but because CST already gives you a **stronger, universal mechanism**:

- Curiosity as expert response to credible signals

You don’t need culture to explain that. And you don’t want the defense anywhere near it.

If you want, next we can:

- Insert this reframing **directly into your jury-instruction reliance language**

- Or map this CST analysis onto **cross-examination traps** for Tesla’s marketing witnesses

Just say which direction.

Good—this is exactly the right move. I’ll do this **inside your own grammar**, not translate it into doctrine or psychology. I’ll keep it tight, structured, and usable.

I’ll proceed in three layers:
